

Complete the ABQ Data Entry Form. We have worked during the last part of the term on it.

The Python script that we created can be downloaded from [here](#) ↓ .

We have made the application to validate some of the entries: Date, Time, Humidity, Light and Temperature. We also made the Lab entry (radio buttons) to behave appropriately.

We created the remaining validation functions (all of these do not validate any of the entries at all), and linked them with the corresponding widget.

This assignment consists in you modifying these validation functions so they **VALIDATE** the remaining entries: Technician, Plot, Seed Sample, Plants, Blossoms, Fruit, Min Height, Max Height, Median Height.

- Technician: a string consisting in two alphabetic words separated by a single space.
- Plot: an integer between 1 and 20, inclusive.
- Seed Sample: a 6 alphanumeric character long string (upper or lower case).
- Plants: an integer between 0 and 20, inclusive.
- Blossoms: an integer between 0 and 1000, inclusive.
- Fruit: an integer between 0 and 1000, inclusive.
- Min Height: a number between 0 and 1000, inclusive.
- Max Height: a number between 0 and 1000, inclusive.
- Median Height: a number between 0 and 1000, inclusive.

To receive the full score your form should run and validate all entries. The Reset and Submit buttons should work appropriately.
